The UM1650/UM1750 series are very low dropout linear regulators designed for low power portable applications. Typical output noise is only $195\mu\text{V}_{\text{RMS}}$ and maximum dropout is just $110\text{mV}(\text{Typ})$ at the load current of 150mA . The internal P-channel MOSFET pass transistor requires no base current, allowing the device to draw only $190\mu\text{A}$ during normal operation at the maximum load current of 350mA . With a shutdown control pin, the UM1750 consumes less than $1\mu\text{A}$ current in shutdown mode.

Other features include high output voltage accuracy, excellent transient response, under voltage lockout, stability with ultralow ESR ceramic capacitors as small as $1\mu\text{F}$, short-circuit and thermal overload protection and output current limiting.

The UM1650 series are available in a low profile SOT23-3 package. The UM1750 series are available in low profile SOT23-5, SOT89-5 and DFN6 2.0×2.0 packages.

Applications

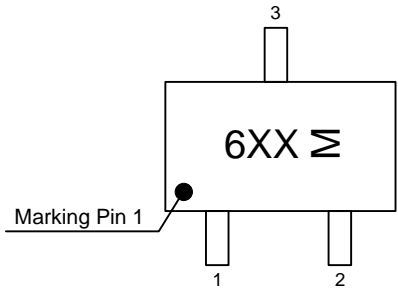

- Bluetooth/802.11 Cards
- PDAs and Notebook Computers
- Portable Instruments and Battery-Powered Systems
- Cellular Phones

Features

- Very Low Dropout: $150\text{mV}(\text{Max})$ at 150mA
- Maximum Input Voltage: 6.0V
- $\pm 2\%$ Voltage Accuracy at $V_{\text{OUT}} > 1.5\text{V}$
 $\pm 30\text{mV}$ Voltage Accuracy at $V_{\text{OUT}} \leq 1.5\text{V}$
- Fast Transient Response
- Under Voltage Lockout
- Fixed Output Voltage of UM1650S-xx and UM1750S/Y/DA-xx from 1.0V to 4.0V with 0.1V Interval
- Adjustable Output Voltage of UM1750S/Y/DA-00 from 1.0V to 5.0V
- Output Current Limit
- Stable with $1\mu\text{F}$ Output Capacitor
- Short-Circuit and Thermal Overload Protection
- Low Profile SOT23-3, SOT23-5, SOT89-5 and DFN6 2.0×2.0 Packages

T _{STG}	Storage Temperature Range	-65 to +150	°C	
T _L	Lead Temperature for Soldering 10 Seconds	+300	°C	

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: The maximum allowable power dissipation of any T_A (ambient temperature) is $P_{D(max)} = (T_{J(max)} - T_A) / \theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown.

Note 3: The UM1650/UM1750 is tested and specified under pulse load conditions such that $T_J \approx T_A$. Specifications over the -40°C to 125°C operating junction temperature range are assured by design, characterization and correlation with statistical process controls.

Note 4: This IC includes overtemperature protection that is intended to protect the device during momentary overload conditions. Junction temperature will exceed 125°C when overtemperature protection is active. Continuous operation above the specified maximum operating junction temperature may impair device reliability.

UM1750S-00/UM1750Y-00/UM1750DA-00 Output Voltage Setting

The output voltage of the UM1750 adjustable regulator is programmed using an external resistor divider as shown in Figure 3. The output voltage is calculated using:

$$V_{OUT} = V_{FB} \left(1 + \frac{R1}{R2} \right)$$

Where: $V_{FB}=1.00V$ (Typ) (the internal reference voltage)

Resistors R1 and R2 should be chosen for approximately 3-5µA divider current. Lower value resistors can be used but offer no inherent advantage and waste more power. Higher values should be avoided, as leakage currents at FB increase the output voltage error. The recommended design procedure is to choose $R2=200k\Omega$ to set the divider current at 5µA and then calculate R1 using:

$$R1 = \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) \times R2$$

Where: $V_{FB}=1.00V$ (Typ).
